AgroBiometrix: Community Extension Radio & Multilingual Voice Dispatcher

System Architecture, Cross-Module Dispatch Event Bus, Sub-Saharan Linguistic Dynamics, and Production API Economics

Author: AgroBiometrix Platform Architecture Team & Naysa-84 Labs | Date: October 2026 | Target Audience: CGIAR, IITA, ILRI, ARCN, FUNAAB, Donors & Institutional Partners

---

Executive Summary & The 'Lab-to-Last-Mile' Imperative:
*Over 70% of Sub-Saharan Africa's 100+ million smallholder farmers are illiterate or semi-literate, with traditional transistor radio serving as their primary, most trusted window to the world. Conversely, national and international agricultural research institutes (IITA, CGIAR, NARS) produce world-class biometrics, soil analyses, and varietal trials that remain trapped in academic PDFs and technical dashboards. AgroBiometrix's **Community Extension Radio & Voice Dispatcher** closes this structural divide by establishing an automated, real-time pipeline that transforms complex biometric diagnoses directly into broadcast-ready vernacular radio bulletins in **Èdè Yorùbá, Harshen Hausa, Kiswahili, Français Agricole, and West African Pidgin**.*

1. System Architecture: The Cross-Platform Dispatch Event Bus

A common flaw in agricultural software is siloed execution: an analytical module calculates a critical finding (e.g. soil acidification or heat stress), but the extension communication layer has no awareness of it. AgroBiometrix solves this by introducing a centralized **Global Agricultural Broadcast Dispatcher & Event Bus** (core/broadcast_dispatcher.py).

Whenever an agronomist, researcher, or extension officer completes an analysis anywhere across the intelligence suites, the system evaluates the finding against critical agronomic thresholds and provides a direct, one-click bridge: **'■ Send to Radio Queue'**.

Table 1: Cross-Module Broadcast Event Triggers Across AgroBiometrix Suites

Originating Suite & Module	Biometric Trigger / Scientific Diagnosis	Captured Extension Remedy	Target Vernacular Broadcast Zone
Module 4/5: Soil Fertility & Fertilizer Optimizer	Soil pH < 5.1, active Al^{3+} toxicity; surface urea causing 40% ammonia volatilization.	Halt surface urea broadcast. Apply 2.5 t/ha lime + compost; micro-dose SSP at root zone.	Yorùbá / French (Oyo, Ogun, Bouaké transition zone)
Module 7: Livestock Biometrics & THI Heat Stress	Temperature-Humidity Index (THI) > 82. Ruminal alkalosis, milk yield drop > 25%.	Shift grazing to crepuscular hours (dawn/dusk); add sodium bicarbonate & salt licks to water.	Hausa / Swahili (Kano, Jigawa, Rift Valley)
Module 8: Agro-Ecosystems & Climate Risk	14-day mid-season rainfall anomaly; Harmattan dust haze attenuating solar PAR.	Immediate organic mulching to conserve root zone moisture; postpone chemical top-dressing.	Hausa / Pidgin (Kaduna, Benue, Niger)
Module 1: AI Research Scientist Copilot	Evidence Gap Synthesis: High yield hybrid lacks Tuwo flour grain density favored by locals.	Recommend paired culinary variety planting; guide post-harvest processing methods.	Hausa / Yorùbá (National extension belts)
Module 7: Cuniculture & Micro-Livestock	Acute doe mortality and bloat from feeding damp, wilted cassava peels (cyanide toxicity).	Strict ban on damp peels; enforce 48-hour mandatory sun-drying before rabbit feeding.	Yorùbá / French (Ondo, Ekiti, Garoua)

2. Dual Operational Modes in the Radio Studio

To satisfy both **mission-critical institutional pitch demonstrations** and **day-to-day dynamic field operations**, the Radio Studio is partitioned into two distinct operational paradigms:

Mode A: Live AI Extension Broadcast Studio & Dynamic Queue (On-The-Fly Generation)

- **Live Action Dispatch Queue**: Inspects the platform event bus, listing all pending biometric diagnoses sent from other modules with timestamps, origins, and one-click '■ Load to Studio' action.
- **Interactive Studio Composer**: Allows research communication officers or extension agents to edit findings or type ad-hoc emergency announcements (e.g. sudden Fall Armyworm or locust swarms).
- **Cultural Heuristic & LLM Synthesis**: Translates technical metrics into indigenous scripts utilizing culturally resonant proverbs (e.g. *'Àb■■ ■■r■■ là ■ s■ fún ■m■lúwàbí'* in Yorùbá, *'Kowa ya tuna bara'* in Hausa, *'Haba na haba'* in Swahili).
- **Interactive Voice Playback & Cue Sheet Export**: Utilizes browser Web Speech API (yo-NG, ha-NG, sw-KE, fr-FR) for instant on-ear listening, and exports formal broadcaster cue sheets (.docx/.txt) ready for FM consoles.

Mode B: Curated Institutional Reference Benchmarks (Pre-Bundled Ground Truth)

- **Fail-Safe Stakeholder Pitching**: Features 4 comprehensive, multi-environment field scenarios (Kaduna Maize, Pastoral Zebu, Commercial Poultry, Cuniculture) across 5 languages.
- **Offline Pre-Bundled MP3 Audio Assets**: All 16 broadcast variations are pre-compiled on disk in assets/audio/. When pitching to IITA or CGIAR boards, the audio plays in **0.001 seconds** without network buffering or cloud API dependency.
- **Acoustic Station Sign-On Chime**: Features a dedicated 3-note harmonic marimba chime (C5-E5-G5) simulating traditional rural radio station alerts.

3. Sub-Saharan African Linguistic Footprint & Acoustic Realities

A critical question asked by institutional donors is: *'Why were these specific languages selected, and how authentic is the speech synthesis?'*

By combining **French & English** (the official institutional and policy languages) with **Swahili, Hausa, and Yorùbá** (plus West African Pidgin), AgroBiometrix achieves direct linguistic penetration across **over 70% of Sub-Saharan Africa's agricultural smallholders**.

Table 2: Linguistic Demographic Footprint and Neural Acoustic Model Status

Language / Dialect	Total Speaker Base	Geographic & Agricultural Corridor	Acoustic Model Fidelity & Synthesis Truth
Kiswahili (Swahili)	150 – 200+ Million	East & Central Africa (Tanzania, Kenya, Uganda, Rwanda, Burundi, DRC, Mozambique)	**100% Authentic**: Non-tonal Bantu structure with regular penultimate stress. Handled flawlessly by standard neural engines.
Harshen Hausa (Hausa)	85 – 100+ Million	The Sahel & Sudan Savanna (Northern Nigeria, Niger, Chad, Northern Ghana/Cameroon)	**Very Authentic**: Deep training across BBC/RFI Hausa. Google and ElevenLabs maintain native ha acoustic models.
Français Agricole (French)	120+ Million (African)	Francophone West & Central Africa (Côte d'Ivoire, Senegal, Cameroon, Mali, Guinea)	**100% Authentic**: Mature global phonetics. Broadcasts sound like seasoned rural radio anchors in Abidjan or Dakar.
Èdè Yorùbá (Yoruba)	50 – 55+ Million	West African Forest & Coastal Transition (Southwest Nigeria, Benin, Togo)	**Strict Tonal Language (Dò-Re-Mí)**: Basic TTS reads Roman letters with flat English intonation. Requires tonal engines (YarnGPT / device yo-NG) for rural elder authenticity.
West African Pidgin	75 – 80+ Million	Urban and peri-urban smallholder belts (Nigeria, Ghana, Cameroon)	**High Clarity**: Highly conversational and engaging. Understood universally in regional markets.

4. Production API Economics: YarnGPT vs. ElevenLabs

A critical architectural principle of AgroBiometrix is **'Write Once, Cache & Stream to Millions'**. When a weekly advisory is formulated for an agro-ecological zone, the speech API is called **exactly once**. The resulting MP3 is stored on cloud storage (AWS S3, Cloudflare R2, or local server). Whether 50 extension agents or 500,000 farmers stream that audio track, **the marginal API cost is $0.00**.

Below is the exact annual budget modeling comparing the specialized Nigerian voice AI (**YarnGPT**) with the global studio leader (**ElevenLabs**) across two production deployment scales:

Table 3: Annual Production Subscription & Operational Cost Models

Production Scale & Scope	YarnGPT (Local African Voice AI)	ElevenLabs (Global Multilingual)	Strategic Recommendation
Tier 1: Standard Regional Extension • 4 Value Chains (Maize, Cassava, Cattle, Poultry) • 3 Languages (Yorùbá, Hausa, Pidgin) • 52 Weekly Updates **Total: 624 Bulletins / Year** (~375k chars)	**Yarn Growth Plan**: • ■15,000 / month • 1 Top-Up pack (■50,000) **Total: ■230,000 / year** (**~$148 USD / year**) *Local Naira billing via Paystack*	**Creator Plan (Annual)**: • $220 / year (2 mos free) • 1,452,000 characters/yr **Total: $220 / year** (**~■341,000 / year**) *Nearly 4× buffer headroom*	**Recommended MVP Budget**: Under **$250 / ■350k per year**. Provides flawless studio French/Swahili and highly localized Nigerian accents.
Tier 2: Full National Syndicate • 10 Value Chains across 6 zones • 4 Languages (Yorùbá, Hausa, Ìgbò, Pidgin) • Bi-weekly Updates (104 updates/yr) **Total: 4,160 Bulletins / Year** (~2.5M chars)	**Yarn Pro Plan**: • ■35,000 / month • 4 Bulk Top-Up packs (■480,000) **Total: ■900,000 / year** (**~$580 USD / year**) *Over 3M credit pool*	**Pro Plan (Annual)**: • $990 / year (2 mos free) • 6,000,000 characters/yr **Total: $990 / year** (**~■1,535,000 / year**) *Studio voice cloning included*	**Commercial Scale**: Budget **$600 to $1,000 / year**. Enables multi-state radio station syndication across hundreds of community FM stations.
Unit Cost per Single 1-Min Radio Bulletin	**~■150 – ■350 ($0.10 – $0.22)**	**~■37 – ■74 ($0.024 – $0.048)**	**Negligible line-item on any donor grant.**

5. Institutional Pitch Strategy & Field Deployment Roadmap

When presenting this capability to agricultural research leaders (IITA, CGIAR, ILRI, ARCN, FUNAAB, and the Federal Ministry of Agriculture), position the Radio Function as the **ultimate solution to the 'Extension Officer Shortage'**:

- **The Extension Crisis Metric**: Nigeria and Kenya have an extension agent-to-farmer ratio worse than 1:3,500 (FAO recommends 1:500). Physical extension agents cannot physically reach millions of remote farmers every week.
- **The Biometric Radio Solution**: AgroBiometrix acts as a force multiplier. One agronomist running a soil test or livestock THI model can generate and dispatch targeted radio bulletins to 50 local community FM radio stations in less than 2 minutes.
- **Voice Cloning for Community Trust**: Highlight that ElevenLabs allows 1-minute voice cloning. A trusted local extension worker or popular university professor's voice can be cloned with permission, ensuring farmers hear a familiar, trusted community voice rather than a robotic voice.
- **Two-Way WhatsApp / IVR Expansion**: Position the radio dispatcher as Phase 1 of the Last-Mile Pipeline. Phase 2 extends this exact event bus to two-way WhatsApp voice notes and toll-free IVR phone lines, allowing illiterate farmers to speak their problems and receive voice advice back.

AgroBiometrix Operational Commitment:
AgroBiometrix bridges laboratory genomics, quantitative biometrics, and rural transistor radio into a unified African digital extension infrastructure. For technical inquiries, API integration, or institutional partnerships, contact: *directorate@agrobiometrix.org* | **Live Platform**: *agrobiometrix.streamlit.app*
